

Montour County Emergency Management Agency

Utility Outage Tips

- ◇ Every family should maintain a home emergency supply kit. Kits should contain items such as an updated family emergency plan, a battery-operated radio, flashlights, a first aid kit and at least three days of food and water for each family member.
- ◇ A list of possible family relocation points should be pre-identified in your family plan in the event the utility outage is going to last for an extended period and makes alternate living arrangements necessary. Part of your kit should be a “go” bag, prepared with all your needs for a stay of at least a few nights to help make the process go smoothly.
- ◇ If a situation arises in which you must seek shelter at a Red Cross Mass Care Center, you may need to make other arrangements for your pets. In Montour County, CART volunteers work hard to support providing pet shelter in association with identified Red Cross shelters. At the very least, you will need to consider your needs as well as your pet’s needs in the event of an evacuation: have ID, license/tag, and medications ready.
- ◇ It is very important that you report utility outages directly to the affected utility, as they need this information to determine the extent of the outage and where to send repair crews. The 911 center does not dispatch utility repair crews, and 911 should only be used in the event of an emergency.
- ◇ For an outage-related problem that creates a fire or safety hazard requiring police, fire, or ambulance services, dial 911 for assistance.
- ◇ During a power outage, refrain as much as possible from opening and closing the refrigerator or freezer to help extend the amount of time before the food spoils. As for food safety: if you are in doubt, throw it out.
- ◇ in anticipation of power being restored, turn off items that use or demand a lot of electricity or that might be damaged by a power surge. Leave something “on” so you will know when the power has been restored.
- ◇ Use only flashlights, battery operated radios, or similar devices. Anything that “burns fuel” to create energy also creates carbon monoxide, a poisonous, odorless, invisible gas.
- ◇ During a power outage, if your well stops operating and water is needed to flush toilets, turn off the power supply (gas or electricity) to your hot water heater and drain it as necessary to supply water for flushing. Remember when the power returns and the water begins flowing again, the hot water tank must be refilled prior to turning on the gas or electricity (which should be done by qualified persons only). If there is a lot of snow, some can be added to a container of water to accelerate melting for toilet flushing. Your emergency kit should contain at least three days of drinking water for each family member.
